

Abstract

Systems and methods applicable, for instance, in session provision. A node and/or other computer may, for example, dispatch to one or more servers and/or the like a message including a provided value and a value obtained, for instance, from a storage element. The one or more servers and/or the like may, for example, having performed various registration checks, act to create a token for provision to the node and/or other computer. Messages sent by the node and/or other computer including the token could, for instance, be considered to be associated with a session.
